STREAMING PRO TIPS

What you need to bring the power of virtual events to your computer, tablet, smart phone, projector, or flat screen.

MOBILE DEVICE
You’ll need to access either a cellular network with a strong 4G or LTE signal, or a Wi-Fi connection with at least 2 Mbps. Check your mobile plan to make sure you have enough available capacity or you may be charged additional fees by your cellular service provider.

PC / LAPTOP
Full HD requires an Internet connection with at least 3 Mbps. Most cable providers offer 10 Mbps and up. If you are unsure about your system’s capacity, please contact your Internet service provider (ISP).

PROJECTOR / TV
Want to stream to a big screen, like a home theater projection screen for a viewing party or your flat screen TV? That’s easy. It’s just like streaming a movie. Connect your computer directly to the projector or TV, or use a Chromecast or Apple TV to connect wirelessly.

FRAME RESOLUTION
Is your stream quality poor? That may depend on your connection, but you can adjust the frame resolution by selecting the gear icon on the player. The resolution is on an “Auto” setting and can be changed. We recommend 720p or more if your connection bandwidth allows it.
